PROFESSIONAL SUMMARY

A **Software Developer** with a strong foundation in Python, JavaScript, SQL, and AI tools to enhance the work. Experienced in building secure full-stack applications, RESTful APIs, and AI-integrated systems. Familiar with basic system design principles including scalability, stateless architecture, and modular service separation. Eager to contribute to engineering teams and grow in a fast-paced development environment.

TECHNICAL SKILLS

Languages: Python · JavaScript · SQL

Frontend: React.js · HTML5 · CSS3 · Streamlit · UI/UX (Figma, Photoshop)

Backend: FastAPI · Node.js · Express.js · RESTful API Design · JWT Authentication · RBAC

Databases: MongoDB · PostgreSQL · MySQL

AI/ML: Groq · BERT · Pandas · NumPy · Generative AI (Prompt Engineering, LLM Integration)

System Design: Stateless Architecture · Modular Service Design · Scalability Basics · API Gateway Patterns · Role-Based Access Layers

Tools: Git · GitHub · Postman · Pytest

WORK EXPERIENCE

Data Annotator | Outlier · Freelance · Remote | Feb 2026 – Present

- Reviewed and evaluated AI-generated code and text outputs against strict quality and accuracy guidelines, providing structured feedback to improve model performance.
- Consistently met productivity and quality benchmarks across high-volume task queues, developing strong attention to detail and process discipline.

PROJECTS

Fake News Verification System | FastAPI, Streamlit, Groq, Live Retrieval API | Mar – May 2025

- Architected a modular FastAPI backend** with a multi-step reasoning layer that retrieves real-time news evidence and classifies claims as REAL, FAKE, or UNCERTAIN — applying clean service separation principles.
- Implemented explainable AI output** with confidence scores and reasoning paths, giving users transparent, interpretable results rather than black-box verdicts.
- Ensured reliability and contract integrity** through Pydantic schema enforcement, rotating file logging for audit trails, and comprehensive Pytest coverage for all pipeline stages.
- Designed the system to be **stateless and horizontally scalable** — each verification request is self-contained with no shared session state, enabling future load distribution.

Employee Leave Management System | React.js, Node.js, Express.js, MongoDB | Sep – Dec 2024

- Built a full-stack application** managing 100+ leave requests with JWT-based authentication and multi-level role-based access control (Admin, Manager, Employee).
- Reduced user interaction time by 15%** through a responsive, component-driven React UI with real-time status updates and intuitive navigation.
- Designed RESTful API endpoints** with clear separation between authentication, business logic, and data layers — following modular backend architecture best practices.
- Maintained structured **audit logs for all transactions** and authored internal documentation to support knowledge transfer and faster onboarding.

E-Commerce Admin Panel with RBAC | Node.js, Express.js, MongoDB | Apr – May 2024

- Implemented dynamic Role-Based Access Control** with granular permission management — separating concerns between user roles, resource access, and system actions.
- Built a centralized admin dashboard** with full CRUD capabilities for user management, role assignment, and access rights — designed for easy extensibility.

AI-Powered Discord Bot | Python, Stable Diffusion API | Aug – Sep 2023

- Built an event-driven bot with **asynchronous message handling** and text-to-image generation via Stable Diffusion API, demonstrating async programming and third-party API integration.

EDUCATION

Bachelor of Computer Applications (BCA) | Assam Downtown University, Guwahati | 2022-25
